AutoCAD is the most widely used CAD software in the world.[1][2] It was used to create 3D models for computer animation and for visual effects in movies, television, video games, and other media,[3] as well as for architectural, engineering, and scientific drawings.[4] In 2018, it was used to create more than 900 million drawings.[5] One of the major features of AutoCAD is the ability to create parametric models. When used in conjunction with solid modeling, they are known as B-rep models. In AutoCAD, 3D models can be represented using either 2D or 3D models.[6][7] 2D is the most common type of model for computer animations and visual effects, since it is easily converted to 3D. 2D models represent objects as a set of line segments or curved segments that represent the exterior and interior surfaces. Their orientation may be either right-side-up or upside-down, and they can be either square or rounded. 3D is the most common type of model for architectural design and technical drawings. 3D models represent objects as a combination of solids, polylines, and surfaces. The interior surfaces can be parametric and can be easily converted to parametric 2D drawings. 3D solids cannot be converted to 2D drawings. 2D and 3D objects can be displayed either upright, with the right side up, or upside down, with the bottom side up.[8] 3D solids can be extruded and viewed in plan, side, top, and/or front views. 3D drawing types are generated by the geometric shape and orientation of the faces, edges, and vertices.[9] The purpose of the solids tool is to form 3D objects, while the polyline tool is used for 2D drafting. Each tool can be used to create new objects or to join objects together. There are two ways to create a 3D object: 3D Extrude: The user selects an object, then inverts its axes by pressing Ctrl + L. The user then drags the corners of the object to create the extruded shape. For more information about the "drag" and "move" tools, see the section called "Create 3D Objects" below. 3D By Object: The user starts by selecting a single face, edge, or vertex of

AutoCAD Architecture AutoCAD Architecture is a 2D/3D modeling application for architecting or designing various structures in the field of construction. It is a multi-platform application which runs on Windows, Mac, Linux, and Unix-based computers. AutoCAD Architecture is composed of a few components which help in the design process. These components include: Basic or main application Desktop environment User interface Model creation and editing Visualization and Documentation tools The basic application is the heart of the application, and it creates a platform which is used for designing various objects, and provides support for creating drawings and sharing documents through different network technologies. Desktop Environment The Desktop environment is composed of a few components such as the monitor, keyboard and mouse. The environment is installed on a system where the AutoCAD Architecture desktop application is installed. When the AutoCAD Architecture desktop application is launched, it opens on the monitor. User Interface AutoCAD Architecture has a user-friendly and attractive graphical user interface. The interface provides a set of commands, buttons and menus to help the user in drawing various components and functionalities of the application. Model Creation and Editing The Model creation and editing functionality is used for creating drawings in AutoCAD Architecture. The model creation and editing component of the application allows creation of 2D and 3D model drawings with various types of objects. Visualization and Documentation tools The visualization and documentation tool component is used for various functionalities such as visualizing, capturing, storing, and uploading to different media. AutoCAD Architecture is a design tool, therefore, it also comes with a few tools for visualizing and sharing the model created by the user. The tools are not mandatory. AutoCAD Architecture also comes with a number of documentation tools for documentation purposes. Model creation in AutoCAD Architecture Model creation in AutoCAD Architecture is a user-friendly feature, because it does not require any programming knowledge. Model creation in AutoCAD Architecture can be performed through a number of methods, such as: Creating a 2D drawing from scratch using the toolbar or menus Creating a 2D drawing from a 3D modeling environment such as Rhino. a1d647c40b
